

# Awaaz Ledger

The AI that remembers how your shop works and finds the next sale.

Awaaz Ledger connects payment patterns, customer behaviour and the merchant's everyday voice notes to spot growth opportunities and turn them into clear, reviewable actions.

Presented by Sumyya Sadre Alam

PAYTM BUILD FOR INDIA AI HACKATHON

# A merchant can see payments. That does not mean they can see the opportunity.

Small businesses often operate on instinct because the useful context is scattered.

## WHAT THEY HAVE

Digital payment history  
Customer transactions  
Daily experience  
Supplier habits

## WHAT THEY MISS

Which customers are drifting away  
Which products are gaining demand  
What changed this week  
Where the next sale may come from

## THE RESULT

The merchant spends time interpreting data — or simply reacts after the opportunity has passed.

**The gap is not lack of data. It is lack of connected business context.**

# Give the merchant a memory, not another dashboard.

Awaaz Ledger turns scattered signals into a simple business timeline.

# Three jobs. One merchant experience.

Awaaz Ledger works quietly in the background, then surfaces only what matters.

## 01 • REMEMBER

Build a timeline of transactions and merchant notes.

Example: “Cold drinks sell faster on Sunday evenings.”

## 02 • FIND

Compare recent behaviour with the merchant’s normal pattern.

Example: repeat customers are declining while new customers rise.

## 03 • ACT

Recommend a measurable next step.

Example: review a win-back offer or prepare more of a fast-moving item.

# A small question becomes a useful decision.

The experience is natural: speak first, then let the system do the connecting.

## MERCHANT SAYS

“Kal Sunday hai. Pichle Sundays mein cold drinks zyada biki thi. Kitna stock rakhun?”

Hindi/Hinglish is treated as normal business input.

## AWAAZ LEDGER CHECKS

Recent sales  
Previous Sundays  
Time-of-day pattern  
Recent customer activity  
Merchant context

## ANSWER

Expected demand: 86–102 units

Recommended stock: ~110 units

Why: the last three Sundays show stronger evening demand.

# “What changed?”

Instead of making the merchant search for a problem, the product brings the important changes to them.

**Good morning — here are the 3 things worth noticing.**

**SALES**

Evening sales are 19% below your usual Tuesday pattern.

**CUSTOMERS**

12 regular customers have not returned in 10+ days.

**OPPORTUNITY**

New-customer payments are up 23% this week.

**Suggested next step: review a win-back offer for the 12 customers.**

# From “something changed” to “here is the opportunity”.

Every recommendation has a reason behind it.

## DETECT

Identify unusual movement:

- sales drop
- product spike
- customer inactivity
- changing purchase times

## EXPLAIN

Compare against the merchant's own history.

Avoid generic advice by using the shop's actual patterns.

## RECOMMEND

Choose one practical action:

- win-back
- stock planning
- promotion timing
- follow-up

Merchant reviews first.

# Payments become the starting point for merchant growth.

We are proposing a product layer around Paytm’s merchant relationship — not assuming access we have not been given.

This directly answers the track: help a Paytm merchant understand their business, find growth opportunities and act.

# The product is proactive without taking control away from the merchant.

That balance is central to trust.

## CHATBOT

Waits for a question.

Good at conversation, but the merchant must know what to ask.

## DASHBOARD

Shows numbers and charts.

The merchant still has to decide what matters.

## AWAAZ LEDGER

Notices a change.  
Explains why.  
Suggests an action.

Merchant approves.

# A focused MVP we can demonstrate

The prototype proves the core loop instead of pretending to build an entire fintech platform.

## 01 • DATA

Synthetic Paytm-style transaction history

## 02 • VOICE

Hindi/Hinglish voice → structured note

## 03 • MEMORY

Merchant timeline + simple relationships

## 04 • INSIGHT

“What changed?” detection

## 05 • FORECAST

One practical demand/growth prediction

## 06 • ACTION

Recommendation + approve button

**Demo flow: Voice note → memory → insight → explanation → recommended action → merchant approval**

# If the product works, the merchant should make better decisions faster.

We measure outcomes, not how many messages the AI generated.

## MERCHANT VALUE

Time saved interpreting data  
Better inventory decisions  
Earlier response to customer drop-off  
More targeted growth actions

## PAYTM VALUE

Deeper merchant engagement  
More useful merchant intelligence  
More opportunities for growth workflows  
Stronger AI-led merchant experience

## NORTH-STAR METRIC

Percentage of meaningful detected opportunities that lead to a merchant-approved action.

The AI is useful only when it changes behaviour.

## THE IDEA

**“Awaaz Ledger remembers the small signals of a merchant’s business — and turns them into the next useful decision.”**

**The merchant should not have to become a data analyst to grow a business.**

**PAYMENT → MEMORY → OPPORTUNITY → ACTION**
